The company is pleased to announce the intersection of gold mineralisation outside the current Sihayo 1 North Resource envelope in recently completed diamond drilling. These holes were completed towards grid south of the Resource envelope, testing for extensions to previously identified mineralised zones.

Drill hole SHDD060 encountered a shallow intercept of **8m @ 2.66g/t Au from surface**, while drill hole SHDD062 intersected near surface mineralization **31m @ 2.38g/t Au from 1m down hole, including 7m @ 6.45g/t Au from 9m** and a further **9.9m @ 2.39g/t Au from 35.1m**. SHDD062 is located approximately 100m north of SHDD048, where broad intercepts of near surface outflow zone mineralisation were encountered.

This drilling confirms the extension of mineralisation towards grid south, outside the current Resource envelope. When combined with mineralised intercepts in earlier holes SHDD057 and SHDD058, drilled to the east of the current Resource envelope, it is apparent that the Sihayo 1 North Resource is open towards both grid south and east.

Notes:

1. All assays were determined by 50gm fire assay
2. A 0.5ppm Au lower cut was used
3. A maximum of 2m of consecutive internal waste (material less than 0.5ppm Au) per reported intersection
4. All interval grades were calculated as a weighted average
5. All intervals reported as down hole lengths
